

THE SOLUTION OF THE BOLTZMANN CONSTANT

$$8.610225818 \times 10^{-5} \times e = k$$

$$2\pi \times 10^{-7} \times 137.036 \times e = k$$

BY

FRANCIS VIREN FERNANDES

DECEMBER 15, 2012

$$PV = nkT$$

If

n = 1 particle

$$PV = kT$$

$$E = E$$

$$P = \frac{I^2}{R^2} = \frac{F}{A}$$

$$V = R_1 \times R_2 \times R_3$$

$$k = 2\pi \times 10^{-7} \times 137.036 \times e$$

$$T = eV = ea$$

My Discoveries

ETHER IN DYNAMIC PULSATE MOTION

$$m_{Pl} \equiv \sqrt{\frac{\hbar c}{G}} = \text{Planck Mass} = 2.176450474 \times 10^{-8} \text{ kg}$$

$$\text{or } \pi B^2 \cdot 137.036 = \pi \cdot (\text{Planck length})^2$$

I have discovered this correspondence in
the dynamic living pulsations of ether

$$B = 1.380668031 \times 10^{-36}$$

WAVE-PARTICLE DUALITY

- Particle:

$$q^2 = M \times R \times 10^7$$

- Wave:

$$\lambda = 2\pi R \times 137.036$$

- Field:

$$\frac{M}{R} = \frac{1.859222909 \times 10^{-9}}{1.380668038 \times 10^{-36}} = 1.346611109 \times 10^{27} \text{ kg/m}$$

ETHER TORUS[\mathcal{T}]

$186 \text{ ether} \times \text{velocity} \times \text{Boltzmann radius} = \text{Planck's } h$

$$1.86 \times 10^{-9} \times 25812.8075 \times 1.380668 \times 10^{-29} = h$$

737 Aitheron \times $f = 186$ -ETHER [E]

ONE 186-PHOTON TORUS \circ

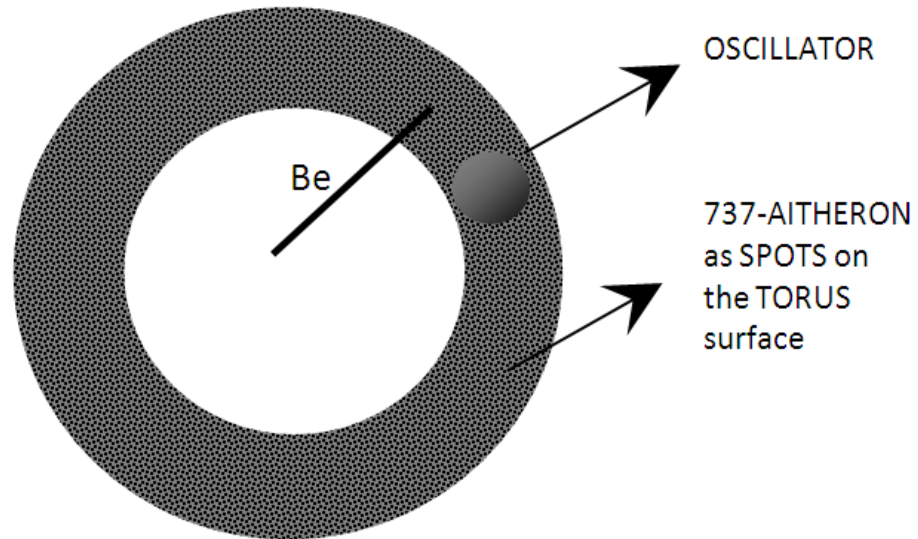

SOLID ANGLE= $4\pi \times 10^{-7}$

TWIN MASS

The Fundamental Structure of Matter & Emanation of Matter

*A pulsating ether sphere * rolling on a spinning pulsating ether torus B*

186-Photon Torus

737 Wave-Maker

The energy of 737 equals the Planck's constant times one second

$$7.37 \times 10^{-51} \times c^2 = h \times 1.0$$

$$1.86 \times 10^{-9} \times V_{Rk} = 7.37 \times 10^{-51} \times c^2 / 1.38 \times 10^{-29} \times 1.0$$

So, the **imposed condition** is **1 second** for the wave-maker to exist.

Coulomb's Constant

$$K = c^2 \times 10^{-7}$$

Velocity squared = $v_1 \times v_2$

$$258128076 \times 3.481818765 \times 10^5 = K$$

The Boltzmann Constant

Superconductivity of SQUID & resistance

The ratio of the velocity of 186-ether to the electrical resistance of a photon, c/e

$$R = \frac{(2\pi \times 10^{-7}) \times 137.036 \times \lambda}{Q \times t}$$

$$25812.8076 \text{ m/s}$$

$$\Omega = c/e = 1.871157469 \times 10^{27} \text{ m/s.C}$$

$$25812.8076 \div \frac{c}{e} = \text{Boltzmann's } k$$

The Coulomb constant

$$25812.8076 \times 34181.8779 \text{ m}^2/\text{s}^2$$

$$f = 2.521836314 \times 10^{41}$$

$$f = \frac{1.859222909 \times 10^{-9} \text{ kg}}{7.37249637 \times 10^{-51} \text{ kg}}$$

$$f \times 1.859222909 \times 10^{-9} = 4.688655847 \times 10^{32} \text{ kg}$$

$$\text{length} = \frac{4.688655847 \times 10^{32} \text{ kg}}{1.346611109 \times 10^{27} \text{ kg / meter}} = 34181.8779 \text{ m}$$

$$25812.8076 \text{ m} = (2\pi \times 10^{-7}) 137.036 \times \frac{\lambda}{t}$$

$$E=mc^2$$

$$25812.8076 \times 3.481818765 \times 10^{12} = c^2$$

Ohm's Law $V=IR$ is $F=ma$

- OHM'S LAW Rewritten as $F = ma$

-

- $V = IR$

- FERNANDES LAW

$$a \times 10^7 = \sqrt{F} \times \frac{c}{e} = \sqrt{I^2} \times \frac{I}{m} = \frac{F}{m}$$

-

-

-

$$R = \frac{(2\pi \times 10^{-7}) \times 137.036 \times \lambda}{Q \times t}$$

- Acceleration, a as volts equals current, I the root of force, F times resistance, R .
-
- Resistance, R is current, I per photon *mass* about **one** 186-seed ether.
-

Voltage is acceleration

Consider 511 keV for an electron

$$\frac{eV}{e} = V$$

$$\frac{511000}{1.60217653 \times 10^{-19}} = 3.1894 \times 10^{24} \text{ Volts}$$

$$\textit{Acceleration} = \frac{c^2 \times 10^{-7}}{r} = \frac{(2.998 \times 10^8)^2 \times 10^{-7}}{2.817940325 \times 10^{-15}} = 3.1894 \times 10^{24} \text{ m/s}^2$$

$$q^2 = M \times R \times 10^7$$

$$(1.602176537 \times 10^{-19})^2 =$$

$$1.859222909 \times 10^{-9} \times 1.380668031 \times 10^{-36} \times 10^7$$

CURRENT

Momentum = $mv = Ft$

$$1.859222909 \times 10^{-9} \text{ kg} \times v = 25 \times 3.20435306 \times 10^{-20} \text{ s}$$

$$v = 4.3087263 \times 10^{-10} \text{ m/s}$$

One coulomb of ether in kg = $1.859222909 \times 10^{-9} \text{ kg} \times 6.24150948 \times 10^{18} = 1.160435741 \times 10^{10} \text{ kg}$

Current is the momentum of one coulomb of ether,

Ether Current I = 5 amps = $1.160435741 \times 10^{10} \text{ kg} \times 4.3087263 \times 10^{-10} \text{ m/s}$ per one coulomb

Energy of ether drift, $E = F r$ where $r = 9.6064088 \times 10^{-12} \text{ m}$ and $F = I^2$

$$E = 25 \times 9.6064088 \times 10^{-12} = 2.4016022 \times 10^{-10} \text{ J}$$

$$E = m (cv) = 1.859222909 \times 10^{-9} (2.99792458 \times 10^8 \times 4.3087263 \times 10^{-10}) = 2.4016022 \times 10^{-10} \text{ J}$$

Copper Current I = 5 amps = $2.672142823 \times 10^{-27} \times 6.24150948 \times 10^{18} \times 2.99792458 \times 10^8$ per one Coulomb

The drift velocity of changed mass $2.672142823 \times 10^{-27} \text{ kg}$ of copper atoms

$$v = 7.34295219 \times 10^{-4} \text{ m/s}$$

$$E = m (cv) = 2.672142823 \times 10^{-27} \times (2.99792458 \times 10^8 \times 7.34295219 \times 10^{-4}) = 5.88235283 \times 10^{-22} \text{ J}$$

$$E = FR = 25 \times 2.352941132 \times 10^{-23} = 5.88235283 \times 10^{-22} \text{ J}$$

Remarks

The drift of ether and atoms of the conductor can be calculated by **$E = m (cv)$**

The mass of copper atoms changed under eVe stress from $1.05520602 \times 10^{-25} \text{ kg}$ to $2.672142823 \times 10^{-27} \text{ kg}$

Maxwell thought that drift velocity was that of electrons. This has now been shown to be a false assumption.

NEWTON'S GRAVITATION CONSTANT DECONSTRUCTED

$$G = \frac{B}{\phi} \cdot c^2$$

or

$$G = \frac{1.38066803 \times 10^{-36}}{1.859222909 \times 10^{-9}} \cdot c^2$$

$$\text{Ether} = 1.346611109 \times 10^{27} \times 6.371 \times 10^6 = 8.57926 \times 10^{33} \text{ kg}$$

Force, F of earth mass, m oscillators $F = m a$

$$F = 8.57926 \times 10^{33} \times 9.82$$

$$F = m \cdot \frac{c^2}{r}$$

$$F = 8.42483332 \times 10^{34} \text{ N}$$

$$F = 8.42483332 \times 10^{34} = m \cdot \frac{c^2}{6.371 \times 10^6}$$

Force of entrained ether $F = m a$

$$m = 5.9748 \times 10^{24} \text{ kg}$$

Entrained Ether for Earth

The acceleration of entrained ether produces an acceleration of 9.8 m/s^2

Radius of Earth $6.371 \times 10^6 \text{ m}$

Magnetism

- MAGNETISM IDENTIFIED

The effect of magnetic flux [LHS] is caused by current [RHS]

$$\Phi = I \times \pi \times r \times 10^{-7} \times 137.036$$

UNIFICATION OF GRAVITY WITH ELECTROMAGNETISM GEM

This is the unification of gravity with electromagnetism which is being searched for because no one cared about the units of eV

MASS

Mass is an attribute of an oscillator measured differently by eV, $R=I/m$ and $F=ma$. These experimental mass measures differ by a rotational factor of

$2 \text{ Pi} \times 10^{-7} \times 137.036$

Francis V. Fernandes (Born 1961)

Idiocy of energy units - It's too bad, but I have already apologized, and there is nothing else I can do...

Richard P. Feynman (1961)

You Feynman recognized the error which physicists and engineers memorized as truth; so here is my solution..

$$T = 2\pi \sqrt{\frac{ml}{mg}}$$

$$T = 2\pi \sqrt{\frac{q^2}{I^2}}$$

$$T = 2\pi \frac{q}{I}$$

$$q = I \times T$$

$$Q = I \times t$$

This formula $Q = I \times t$ represents a physical reality when squared

$$q^2 = I^2 \times t^2$$

$$m \times r \times 10^7 = F \times t^2$$

$$F = m \times \frac{r \times 10^7}{t^2}$$

$$F = m \times a$$

$$PV=kT$$

$$\frac{I^2}{R^2} \times R_1 \times R_2 \times R_3 = 2\pi \times 10^{-7} \times 137.036 \times e \times eV$$

$$R^2 = R_1 \times R_3$$

$$\frac{h}{2e} = BA = \frac{I}{R^\circ} \times R_1 \times R_3$$

$$P = \frac{F}{A} = \frac{I^2}{R_1 \times R_3}$$

METHOD

- $CV = \text{velocity squared}$
- $E = PV = kT = eVe = eae = hf = mc^2$
- $m \times r = e^2$
- $\Phi = I \times \pi \times r \times 10^{-7} \times 137.036$

I know the formulas for volts, current and resistance

$$a = I \times I/m$$

Time period of a pendulum

Spectroscopy

The mass of a proton, m_2 is changed from $1.672622216 \times 10^{-27}\text{kg}$ to $3.634114179 \times 10^{-29}\text{kg}$ when 0.068amps of current is passing thru water during electrolysis

The energy as measured for a proton $E = F R = I^2 R$

The radius of a proton $q^2 = m R 10^7$ and so

$$R = 1.5347 \times 10^{-11} \text{m}$$

$$E = 0.068^2 \times 1.5347 \times 10^{-11} = 7.0964528 \times 10^{-14} \text{ J}$$

$$E = m_1 c^2 \text{ and so } m_1 = 7.895868606 \times 10^{-31} \text{kg}$$

Originally before electricity was passed the energy of the proton $E = mc^2$

$$E = 1.672622216 \times 10^{-27} \times c^2 = 1.503275 \times 10^{-10} \text{ J}$$

$$E = I^2 R$$

$$1.503275 \times 10^{-10} = 0.068^2 \times R$$

$$R = 3.251029 \times 10^{-8} \text{ m}$$

$$Q^2 = 7.895868606 \times 10^{-31} \times 3.251029 \times 10^{-8}$$

In any interaction its always

$l_1 \times l_2$ or $m_1 \times m_2$ or $r_1 \times r_2$

So $m_1 \times m_2 = 7.895868606 \times 10^{-31} \text{kg} \times 1.672622216 \times 10^{-27}$

Square root of these masses =

$3.634114179 \times 10^{-29} \text{kg}$ [$R = l / m$]

$Q^2 = 3.634114179 \times 10^{-29} \times 7.063536 \times 10^{-10}$

This is the oscillator that yields the **clock frequency**

The radius of the proton changes from $R = 1.5347 \times 10^{-11} \text{m}$ to $7.063536 \times 10^{-10} \text{m}$

$$\Omega = \frac{I}{m} = 1.871157469 \times 10^{27} \text{ amp} / \text{kg}$$

$$\Omega = \frac{0.068}{m}$$

$$m = 3.63411424 \times 10^{-29} \text{ kg}$$

Transient mass

The Planck energy involves $2\text{Pi} \times 137.036$

$$E = m \times 2\text{Pi} \times 137.036 \times c^2 \times 10^{-7} = 2.81225386 \times 10^{-16} \text{ J}$$

$$E = h f$$

$$f = 4.24422646 \times 10^{17} \text{ Hz}$$

$$t = 1/f = 2.35614196 \times 10^{-18} \text{ s}$$

$$18000 / 2.35614196 \times 10^{-18} = 7.639607603 \times 10^{21}$$

Thus the time for hydrogen to evolve at the cathode is inversely proportional to the frequency of the changed mass of a proton under external current stress during electrolysis of water.

Mass Length Time period

This experiment is conclusive evidence that

- Our measure of mass is at light speed. Mass is already at light speed.
- The frequency of the oscillator changes drastically on insults
- Frequency change means mass and radial length change
- I am able to crack these issues because voltage is acceleration, current squared force and resistance always constant at 1.87×10^{27} amp/kg or velocity / elementary charge

Magnetism

- $h/2e = l \times \text{Pi} \times R \times 137.036$
- $\Phi = 0.068 \times \text{Pi} \times 7.0635359 \times 10^{-17} \times 137.0359991$

I have deconstructed the magnetic flux quantum.

Gravitational force

$$F = mg = 0.008\text{kg} \times 9.8 = 0.0784 \text{ N}$$

$$F = I^2 = 0.392 \text{ A} \times 0.2 \text{ A} = 0.0784 \text{ N}$$

- So, current of 0.392 A is required to flow thru a 0.50 m 8.0g conductor placed 90 degrees to the magnetic field, of strength 0.40 T for a levitation effect.
- Let us consider current generated by the magnetic field, B of 0.4 T on 0.5m length of the conductor.
- $I = 0.4 \text{ T} \times 0.5 \text{ m} = 0.2 \text{ A}$
- $F = I^2 = 0.392 \text{ A} \times 0.2 \text{ A} = 0.0784 \text{ N}$

The Rydberg Mass

13.6 eV the first ionization electron volt ~~energy~~ of an electron for the hydrogen atom corresponds to a Rydberg photon and not a 511 keV electron

$$13.60569223 \times e = 2.179872077 \times 10^{-18} \text{ J}$$

$$E = mc^2 \text{ and so } m = 2.425434789 \times 10^{-35} \text{ kg}$$

The Reason for Spectra

$$2.425434789 \times 10^{-35} \times c \times \lambda = h$$

inverse of lambda is the Rydberg number

$$\text{Radius } R = 1.5347 \times 10^{-11} \text{ m}$$

$$\text{Energy } E = F \times R = I^2 \times R$$

$$E = mc^2 \quad \text{where } m \text{ is external photon}$$

$$\text{Resistance } \Omega = \frac{I}{m_{\text{rydberg}}} = \frac{c}{e} = 1.871157469 \times 10^{27} \text{ m/sC}$$

$$m_{\text{rydberg}} = \sqrt{m_{\text{proton}} \times m_{\text{externalphoton}}}$$

Changed measured mass

1. Maxwell drift of changed copper mass
2. Electrolysis of water
3. Spectrum of Hydrogen
4. A magnetic field which contributes to gravitational force of a rod. I have shown how a plane has lift in a similar manner.

THERE IS ONE MASS [$7.37 \times 10^{-51} \text{kg} \times f$] MEASURED DIFFERENTLY AS IT MOVES ALONG 4 PATHS NAMELY

R_1 R_2 R_3 R_0

Twin Mass –Ether & Matter

Point mass 737-wavemaker must exist

186-Photon Torus

Twin Mass Structure

Ether Mass and associated charge

$$7.372496 \times 10^{-51} \text{ kg Oscillator} \times \text{frequency}, f = \text{Photon mass}$$

$$c = f \times \lambda$$

$$\begin{array}{l} \text{Photon mass} \times \# = 1.859222909 \times 10^{-9} \text{ kg} \\ \text{(Matter)} \qquad \qquad \qquad \text{(Elementary charge / oxidation state)} \end{array}$$

$$1.859222909 \times 10^{-9} \text{ kg Torus} \times \# = \text{Ether Mass}$$

(186-ether)

$$\frac{\textit{ethermass}}{1.346611109 \times 10^{27} \text{ kg} / m} = \textit{radiusofphoton}$$

STRUCTURE OF SPACE

1. Twin mass = Ether and Matter
2. Etheric sea = Ether and Ether
3. Void = Soul

Entropy Units! ????

$$S = \frac{H}{T \times \text{mol}}$$

$$S = \frac{eV}{\text{mol}} \times \frac{e}{T} = \frac{T^*}{\text{mol}} \times \frac{e}{T}$$

$$S = \frac{eVe}{eV \times \text{mol}} = n \times e \times \text{mol}^{-1}$$

Entropy

Slowing down of photon speed is my idea of generating free energy from the structure of space

Entropy is the energy required to raise the energy of one mole of substance from zero to 298 kelvin

I would redefine entropy as the energy input to slow down speed of a photon from ***light speed c to drift velocity v***

$$E = mc^2 = m \times 25812.8076 \times 3.481818 \times 10^{12}$$

$$E = m \times c \times v$$
